Rubio N., Sharp P.M., Rits M., Zahedi K., Whitehead A.S.;

"Structure, expression, and evolution of guinea pig serum amylo
component and C-reactive protein.";

J. Biochem. 113:277-284(1993).

C-!- FUNCTION: Displays several functions associated with host of
the promotes agglutination, bacterial capsular swelling,
phagocytosi and complement fixation through its calcium-der
phagocytosi and complement fixation through its calcium-der
binding to phosphorylcholine. Can interact with DNA and his
cond may scavenge nuclear material released from damaged
circulating cells (By similarity).

-!- SUBUNIT: Homopentamer. Pentaxin (or pentraxin) have a disco
arrangement of 5 noncovalently bound subunits (By similarity
-!- SUBCELLULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Found in plasma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

C-reactive protein precursor.
Name=Crp; Synonyms=Ptx1;
                                                                                                                                                it promotes agglutination, bacterial capsular swelling, phagocycosi and complement fixation through its calcium-dependent binding to phosphorylcholine. Can interact with DNA and histones and may scavenge nuclear material released from damaged circulating cells (By similarity).

SUBUNIT: Homopentamer. Pentaxin (or pentraxin) have a discoid arrangement of 5 noncovalently bound subunits. Two of the five chains form a dimer linked by two interchain disulfide bonds located in the C-terminal heptapeptide and specific to rat CRP.

I SUBCELIULIAR LOCATION: Secreted.

I TISSUE SPECIFICITY: Found in plasma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cDNA cloning with additional studies

(er) Worm Breeder's Gazette 15(1):54(1997).

-I- FUNCTION: Nematode cuticles are composed largely of collagen-like proteins. The cuticle functions both as an exoskeleton and as a barrier to protect the worm from its environment.

-I- SUBUNIT: Collagen polypeptide chains are complexed within the cuticle by disulfide bonds and other types of covalent cross-links.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Thacker C.M., Rose A.M.;

CATALYTIC ACTIVITY: ATP-dependent breakage, passage and rejoining of double-stranded DNA.

SUBUNIT: Made up of two chains. The A chain is responsible for DNA breakage and rejoining; the B chain catalyzes ATP hydrolysis. The enzyme forms an A2B2 tetramer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SIMILARITY: Belongs to the type II topoisomerase family
                                                                                                                                                                             ,; AJ235272; CAA1

Bacteriol. 186:5842-5855 (2004).

RL J. Bacteriol. 186:5842-5855 (2004).

CC -!- FUNCTION: DNA gyrase negatively supercoils closed circular double-
cc stranded DNA in an ATP-dependent manner and also catalyzes the
cc interconversion of other topological isomers of double-stranded
cc DNA rings, including catenanes and knotted rings (By similarity).

CC -!- CATALYTIC ACTIVITY: ATP-dependent breakage, passage and rejoining
cc -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase family.

CC -!- SIMILARITY: Belongs to the type II topoisomerase
